

Situation of 15 January 2020 edition of the hours 14-next update 17-01-2020 hours 14, forecaster: AM

reliability: 80%

Increase in danger up to 2 (moderate) on the Alps during the day due to thermal increase.

Thermal Zero: 3000 m T.average 1000: 2 °C T.average 2000: 1 °C

Weather by OSMER - ARPA FVG:

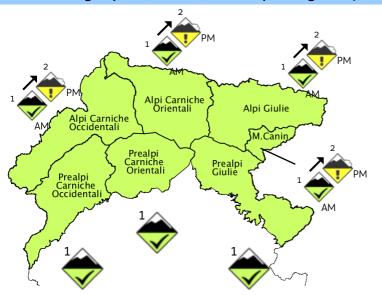

Mostly clear or little cloudy skies. Thermal inversion in the valleys.

Station	quota (m)	snow depth (cm)	fresh snow (cm)	Tmin (°C)	Tmax (°C)
RIFUGIO TAMAI - ZONCOLAN	1750	82	0	-4	1
VARMOST M.TE SIMONE	1870	106	0	-3	1,5
SELLA NEVEA - LIVINAL LUNC	1837	250	0	-2,5	0,5
PIANCAVALLO	1280	0	0	-5	-1
TARVISIO	800	2	0	-1,5	5

Snow cover conditions and avalanche danger: Clear skies with increase in freezing point up to 3000 m. On the Alps, the avalanche danger is 1 (low) increasing up to 2 (moderate) during the day:above 2000 m in all aspects of the steep slopes with wind-drifted deposits it is possible to have human triggered avalanches mainly with high additional load, especially during the hottest hours of the day. Triggering may generally be of medium size. The natural avalanche activity is limited to some discharges, possibly also formed by icy blocks, from the steepest sunny slopes, in particular in areas with cropping rock. There will still be a latent gliding avalanche danger on grassy slopes more sunny. On the Prealps the danger will be 1 (low): some small human triggering will be possible on very steep slopes in the summit areas. Everywhere, pay attention to the presence of large frozen areas.

Forecast for Thursday 16 January 2020, reliability: 70%

Increase in danger up to 2 (moderate) on the Alps during the day due to thermal increase.

Weather by OSMER - ARPA FVG:

Mostly clear or little cloudy skies. Thermal inversion in the valleys.

Snow cover conditions and avalanche danger: Nice weather expected with freezing point at 2000 m. On the Alps, the avalanche danger is 1 (low) increasing up to 2 (moderate) during the day:above 2000 m in all aspects of the steep slopes with wind-drifted deposits it is possible to have human triggered avalanches mainly with high additional load, especially during the hottest hours of the day. Triggering may generally be of medium size. The natural avalanche activity is limited to some discharges, mainly from the steepest sunny slopes, in particular in areas with cropping rock. There will still be a latent gliding avalanche danger on grassy slopes more sunny. On the Prealps the danger will be 1 (low): some small human triggering will be possible on very steep slopes in the summit areas. Everywhere, pay attention to the presence of large frozen areas.

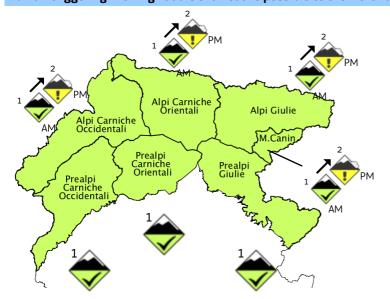

AVALANCHE BULLETIN n.29 the 15 January 2020

EAWS

Forecast for Friday 17 January 2020, reliability: 60%

Human triggering with high additional load is possible to the North above 2000 m. Watch out ice!

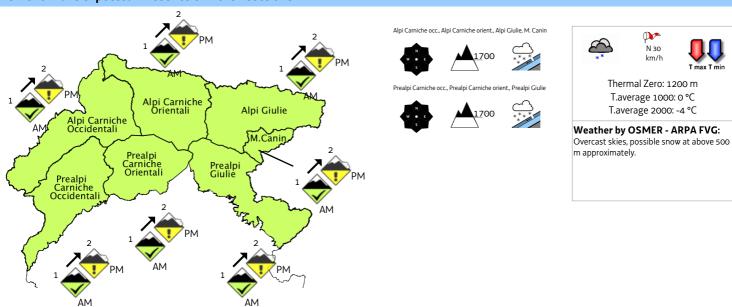

Thermal Zero: 3000 m T.average 1000: 3 °C T.average 2000: 0 °C

Weather by OSMER - ARPA FVG: Generally clear or little cloudy skies for glazing at altitude. Thermal inversion in the vallevs

Snow cover conditions and avalanche danger: Mostly little cloudy skies. On the Alps, the avalanche danger will be 1 (low) increasing up to 2 (moderate) during the day:above 2000 m in all aspects of the steep slopes with wind-drifted deposits it will be possible to have human triggered avalanches mainly with high additional load, especially during the hottest hours of the day. Triggering may generally be of medium size. On the Prealps the danger will be 1 (low): some small human triggering will be possible on very steep slopes in the summit areas. Everywhere, pay attention to the presence of large frozen areas.

Forecast for Saturday 18 January 2020, reliability: 60%

New snowfalls expected. Presence of frozen sections.

Snow cover conditions and avalanche danger: Uncertain forecast for Saturday as new snowfalls are generally expected, from light to moderate, above 500-600 m. The danger will probably be 1 (low) increasing up to 2 (moderate) everywhere: in relation to the amount of new snow fallen, avalanche triggering of small and medium sized loose snow will be possible from steep slopes and along the usual routes and in all aspects. The human triggering will be possible even with low additional load in the newly formed deposit areas, in particular under ridges, crossings and steeper gullies.
