PIANCAVALLO	1280	0	0	-3	5
TARVISIO	800	0	0	-3,5	13,5

**Snow cover conditions and avalanche danger:** Variable skies and increase in temperatures. On the Alps and Canin the avalanches danger is 2 (moderate): small natural avalanches are possible from steep sunny slopes, especially near the rocks. Under 2000 m, during the hottest hours of the day, the natural avalanches activity is not excluded on the less sunny slopes as well. Generally above 1800 m, in areas with wind-drifted snow, the human triggered avalanches, small and medium in size, is possible with high additional load. On steep slopes, in areas where deposits are more significant, triggering can also occur with a low additional load. On the Prealps the danger is 1 (low): small natural discharges from the very steep slopes are possible in particular from sunny slopes. At higher altitudes, at very localized areas of the northern slopes, human triggered avalanches, small in size, are possible with a high additional load.

# AVALANCHE BULLETIN n.63 the 03 April 2020

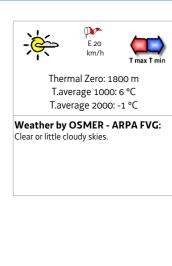

Forecast for Sunday 05 April 2020, reliability: 80%

## Small natural avalanches are possible during the hottest hours.

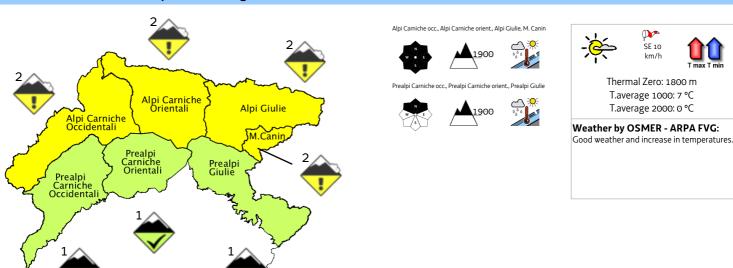

**Snow cover conditions and avalanche danger:** Clear or little cloudy skies. On the Alps and Canin the avalanches danger will be 2 (moderate): small natural wet loose snow avalanches will be possible from steepest slopes during the hottest hours of the day, in particular from the sunny ones. In areas with wind-drifted snow deposits, generally located above 1900 m, human triggered avalanches, small in size, will be possible with high additional load. At higher altitudes, on the steep slopes of the northern slopes, triggering may occur even with low additional load, due to increase in temperatures such situation may occur during the day on all the slopes. On the Pre-Alps the danger will be 1 (low): on very steep slopes, particularly on sunny slopes, small natural triggering will be possible. At the highest altitudes, in very localized areas of the northern slopes, triggering of small avalanches will be possible with high additional load.

# Forecast for Monday 06 April 2020, reliability: 80%

### Small natural avalanches are possible during the hottest hours.

Snow cover conditions and avalanche danger: Good weather and increase in temperatures. On the Alps and Canin the avalanches danger will be 2 (moderate): small natural wet loose snow avalanches will be possible from the steepest slopes during the hottest hours of the day, in particular from the sunny ones. In areas with wind-drifted snow deposits, generally located above 1900 m, human triggered avalanches, small in size, will be possible with high additional load. At higher altitudes, on the steep slopes of the northern slopes, triggering may occur even with a low additional load, due to increase in temperatures such situation may occur during the day on all the slopes. On the Pre-Alps the danger will be 1 (low): on very steep slopes, particularly on sunny slopes, small natural triggering will be possible. At the highest altitudes, in very localized areas of the northern slopes, triggering of small avalanches will be possible with high additional load.
