Thermal Zero: 2800 m  
T.average 1000: 10 °C  
T.average 2000: 4 °C

**Weather by OSMER - ARPA FVG:**

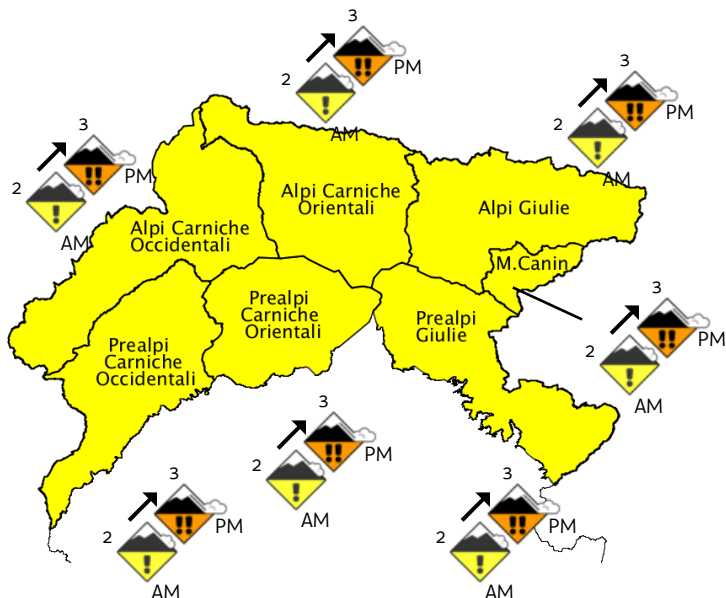

Mostly cloudy skies. Chance of moderate scattered rain showers, even thunderstorms, especially in the afternoon.

Station	quota (m)	snow depth (cm)	fresh snow (cm)	Tmin (°C)	Tmax (°C)
PIANCAVALLO	1280	-nd	-nd	-nd	-nd
TARVISIO	800	15,0	0	7,7	16,2
SELLA NEVEA - LIVINAL LUNC	1837	387,0	0	2,8	6,1
RIFUGIO TAMAI - ZONCOLAN	1750	217,0	0	2,7	4,9
VARMOST M.TE SIMONE	1870	102,0	0	2,4	7,1

**Snow cover conditions and avalanche danger:** Mostly cloudy skies with the possibility of scattered rain showers and thunderstorms. Snow will only fall on the tops of the highest mountains. The snowpack is generally wet on the surface, due to rain and high temperatures. Throughout the entire territory, avalanche danger is 2 (moderate). On steep slopes at all exposures, medium and, in some cases, large wet-snow avalanches are possible on snowier northern slopes. Wet-snow avalanches may be triggered on the superficial layers of the snowpack even with the passage of single skiers-hikers and may even reach medium size.

Forecast for Saturday 01 May 2021, reliability: 70%

**Chance of wet-snow avalanches, even very large.**

T.average 1000: 12 °C  
T.average 2000: 5 °C

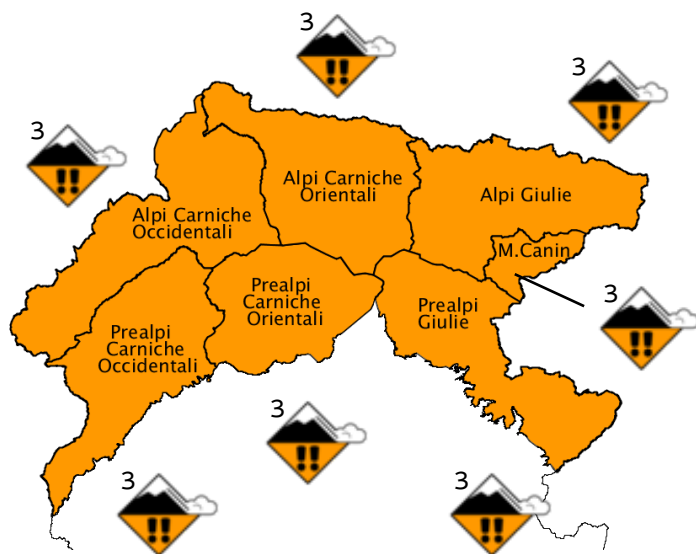

**Weather by OSMER - ARPA FVG:**

Variable skies, chance of local showers. During the night into Sunday, a marked deterioration is likely.

**Snow cover conditions and avalanche danger:** Variable cloudiness with possible scattered rain showers and some thunderstorms. From the evening, conditions will probably worsen with widespread rainfall. Throughout the entire territory avalanche danger will be 2 (moderate) increasing to 3 (considerable) during the day. The predicted weather conditions and high temperatures will lead to an increased instability of the snowpack. On steep slopes, at all exposures, medium and, in some cases, large wet-snow avalanches will be possible. On snowier northern slopes, very large isolated phenomena may occur. Wet-snow avalanches may be triggered even with the passage of single skiers-hikers and locally may even be large in size.

Forecast for Sunday 02 May 2021, reliability: 60%

Chance of both natural and even very large avalanches.

T.average 2000: 2 °C

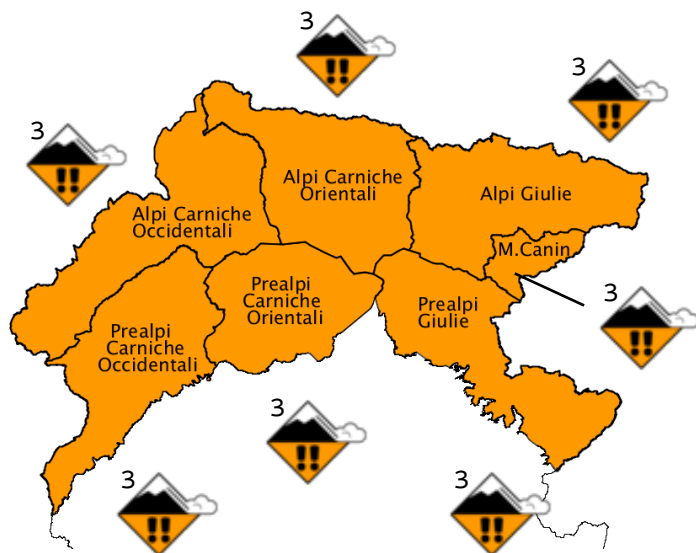

#### Weather by OSMER - ARPA FVG:

Variable cloudiness, continued showers and scattered thunderstorms. Abundant snowfall above 1500 m.

**Snow cover conditions and avalanche danger:** During the night, abundant to intense rainfall in all areas, accompanied by strong winds, variability during the day with continued showers. 20-30 cm of new snow may fall above 2000 m and, starting in the evening, chance of snow 1500-1600 m. Throughout the entire territory, avalanche danger will be 3 (considerable). The forecasted meteorological conditions will determine an increase of the instability of the snowpack. On steep slopes, at all exposures, wet-snow avalanches, even large ones, are possible and, on isolated northern slopes, very large in size. Slip avalanches on very steep grassy slopes are also possible. Wet-snow avalanches may be triggered even with the passage of single skiers-hikers and may also be large in size. Above 2000 m, chance of triggered release slab of new snow with low overload. Unfavorable conditions for excursions.

Forecast for Monday 03 May 2021, reliability: 60%

Chance of both natural and triggered avalanches, even with low overload.

T.average 2000: 1 °C

#### Weather by OSMER - ARPA FVG:

Generally variable skies. Chance of several showers and thunderstorms.

**Snow cover conditions and avalanche danger:** Variable skies with some weak snowfall above approx. 1600 m. A drop in temperatures is expected. Throughout the territory, avalanche danger will continue to be 3 (considerable). On steep slopes at all exposures, wet-snow avalanches of medium and, in some cases, large ones, will be possible, especially below 2000 m. Wet-snow avalanches may still be triggered even with the passage of single skiers-hikers and locally may even be large in size. Above 2000 m on steep slopes with wind-drifted accumulations, triggered avalanches with dry snow slabs may occur even with the passage of single skiers-hikers. Avalanches at a local may also affect part of the old wet snowpack, therefore, becoming large in size.
